

What is CARTAID?

CARTAID - is a Shopping Assistant that utilizes Natural Language Processing (NLP) technology to interpret user queries for products and gifts. Users interact through a chat-style interface to communicate their shopping requirements. **CARTAID** seamlessly integrates with the Amazon API, providing real-time product recommendations based on user inquiries.

RELEVANT BENEFITS

Precision in Search

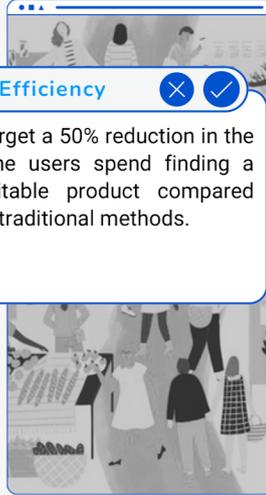

Empower users, including those who struggle with keyword-based searches, to effortlessly discover products using natural language queries

User Efficiency

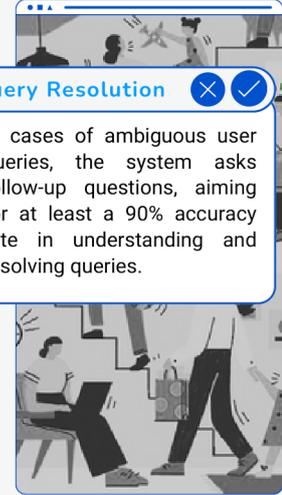

Target a 50% reduction in the time users spend finding a suitable product compared to traditional methods.

Adaptive Query Resolution

In cases of ambiguous user queries, the system asks follow-up questions, aiming for at least a 90% accuracy rate in understanding and resolving queries.

IMPLEMENTATION & TECHNOLOGIES

Back-end:

- .NET C#
- MongoDB
- GraphQL
- Unit/Integration Tests

Web Client - Blazor C#

Web Admin - Angular

Mobile (iOS + Android) - Flutter

External API:

- OpenAI
- Amazon

Version control - git + Github

Dev tools - VS Code + Devcontainers

Deployment:

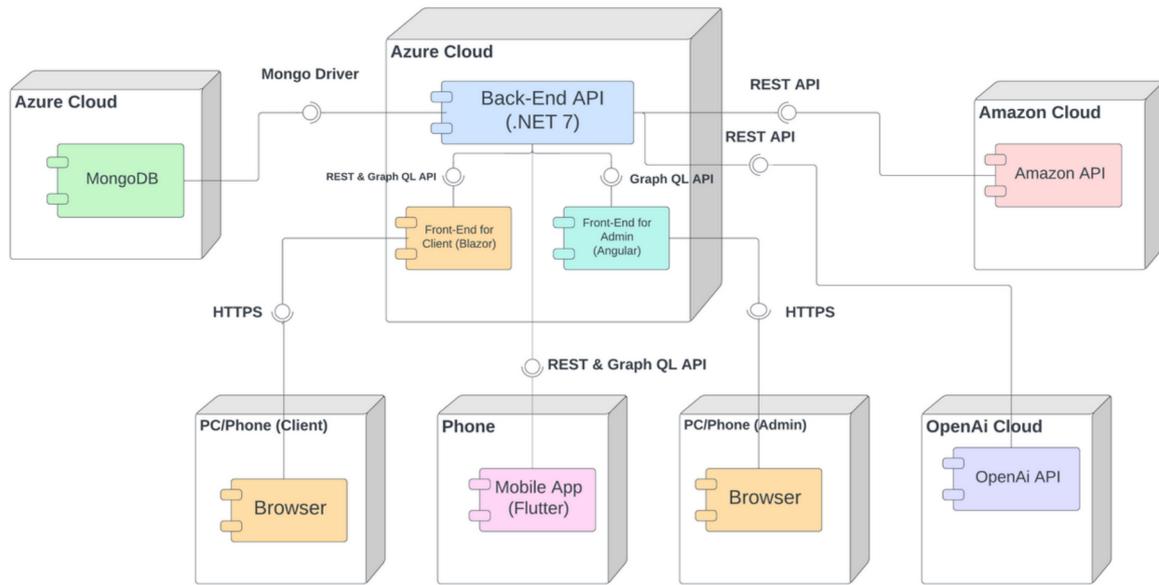

- Azure + CI/CD via GitHub Actions

Management - Jira

SCRUM MANAGEMENT

The main idea of our product team is for a group of specialists to work as a single organism aimed at achieving product goals and responding to customer or user needs.

ESTIMATIONS

Our team used Agile Poker as it provided an effective and collaborative approach to estimating the complexity of tasks during our Sprint Planning sessions.

CARTAIID ANDROID APP

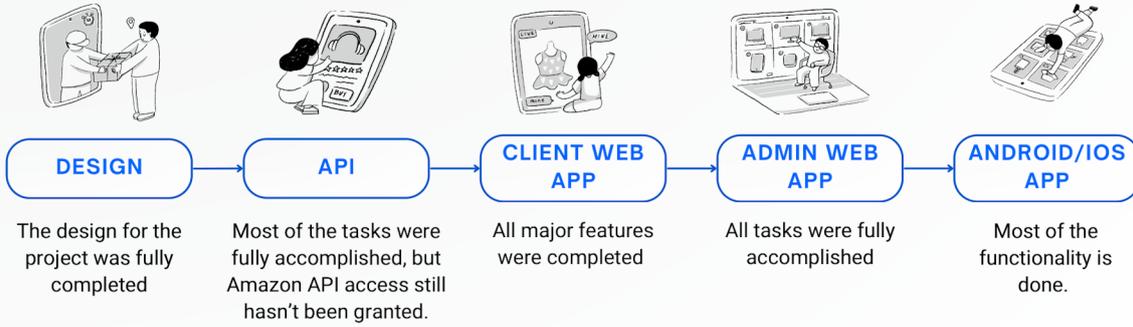

PROJECT READINESS

The project creation process was divided into major components:

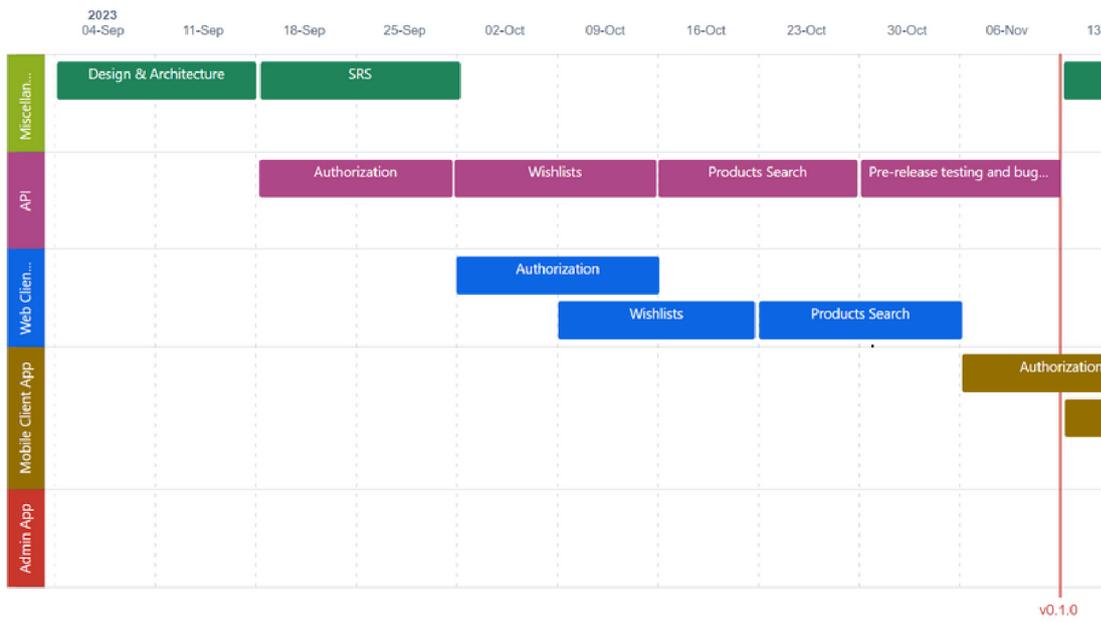

- Web Api
- Client Web App
- Admin Web App
- IOS/Android App
- Web/Mobile App Design

These components collectively form the foundation of our project, bringing together the power of a comprehensive web API, a feature-rich client web app, and a mobile-friendly iOS app.

ROADMAP

ROADMAP

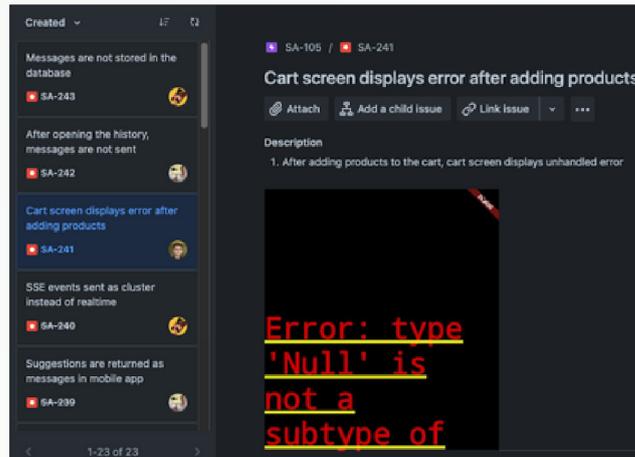

BUG FIXES

We came across **23 bugs** while developing, mostly dealing with API and frontend issues.

Fixing these problems not only helped us sort out technical issues but also made our final product better, providing a smoother user experience.

TESTING

SA-105 / SA-224

Test Products Search in Mobile App

Description

Acceptance criteria

1. Verify access (Guest login)
2. Verify wishlist creation
3. Verify message sending
4. Verify suggestions for question answers
5. Verify wishlist name creation
6. Verify products in shopping cart
7. Verify wishlists list in menu

Test Explorer

Test run finished: 65 Tests (65 Passed, 0 Failed, 0 Skipped) run in 19,5 sec

Test	Duration	Traits
ShoppingAssistantApi.Tests (61)	18,6 sec	
ShoppingAssistantApi.Tests.Tests (61)	18,6 sec	
AccessTests (12)	727 ms	
ProductsTests (2)	10,8 sec	
RolesTests (4)	4 sec	
UsersTests (10)	840 ms	
WishlistsTests (33)	2,2 sec	
ShoppingAssistantApi.UnitTests (4)	157 ms	
ShoppingAssistantApi.Tests.Tests (3)	84 ms	
ProductTests (3)	84 ms	
ShoppingAssistantApi.UnitTests (1)	73 ms	
OpenAiServiceTests (1)	73 ms	

We wrote **61 Integration Tests** and **4 Unit Tests** to ensure that separate pieces and system as a whole works as expected.

VERSION CONTROL SYSTEMS

Git was used as the version control system. The repositories were kept on Github.

CONCLUSIONS

- Clear goals and objectives guiding the project direction.
- Effective communication channels for seamless information sharing.
- Allocated roles and responsibilities based on strengths and expertise.
- Collaborative planning and decision-making processes.
- Comprehensive project timeline with specific milestones and deadlines.
- Positive team environment fostering effective teamwork and skill utilization.
